Allowable Subject Matter

Claims 1-4,7-16,19-25 and 28-31 are allowed.

The following is an examiner's statement of reasons for allowance: The present invention is directed to method for adjusting a digital image obtained from scanning a document. The above identified claims includes the uniquely distinct features "defining a plurality of at least substantially diagonal processing lines relative to the target orientation, each processing line having a first position tangentially aligned to different corner of the image; repositioning each of the processing lines a predetermined distance towards a center of the target orientation until each of the processing lines intersects one of the pixels having a pixel value substantially different than previously processed pixels; and recording a location of each of the intersected pixels" and "defining at least one horizontal processing line relative to the target orientation, horizontal processing line having a first position coincident with a top side or a bottom side of the image; defining at least one vertical line relative to the target orientation, vertical processing line having a first position coincident with a right side or a left side of the image; repositioning each of the horizontal and vertical lines a predetermined distance towards a center of the target orientation until each of the processing lines intersects a pixel having a pixel value substantially different than previously processed pixels; and recording a location of each of the intersected pixels" The closest prior art, Jia et al (US 6,430,320) discloses a similar system, either singularly or in combination, fail to anticipate or render the above underlined limitations obvious.
